

I support network neutrality. The neutrality of service providers toward the content and services is at the heart of the open internet. Without the regulatory power granted by Title II, the FCC would not be able to stop broadband providers from engaging in a wide range of discriminatory practices including charging content providers more to deliver their content at higher speeds, blocking content they don't like or approve of or that competes with their own offerings. Innovation, small business, and free speech are all at stake. Moreover, the rights of consumers to access online content are at stake. Elimination of network neutrality will leave consumers at the mercy of their broadband provider's discriminatory treatment of websites and content providers; this will be particularly problematic for those living in less populated areas who have few choices of ISP's.
